Mold and Pregnancy

In every pregnancy, a woman starts out with a 3-5% chance of having a baby with a birth defect. This is called her background risk. This sheet talks about whether exposure to mold may increase the risk for birth defects above that background risk. This information should not take the place of medical care and advice from your healthcare professional.

What is mold?
Molds are fungi that can be found both indoors and outdoors. They grow best in warm, damp, and humid places. Molds spread and reproduce by making spores that are able to live almost anywhere.

Mold can be many different colors and usually grows as spots in damp or water damaged areas. Mold can also have a musty, earthy smell. The four most common household molds are Cladosporium, Penicillium, Alternaria, and Aspergillus.

Can mold make me sick?
Molds themselves won’t make you sick, but some molds can produce substances that can cause health problems. Symptoms from mold exposure may include allergic reactions such as stuffy nose, eye irritation, rashes, wheezing, and possibly fever and shortness of breath. Not everyone will have these symptoms. People who have a weak immune system or have a chronic respiratory condition, such as asthma, may be more sensitive to mold. If mold exposure is causing you to have any of these symptoms, you should talk to a healthcare provider as soon as possible.

How do I keep mold out of buildings and homes?
- Use exhaust fans in kitchens and bathrooms.
- Clean bathrooms with mold killing products. Wear non-porous gloves and eye protection; and have good air ventilation while cleaning.
- Do not carpet bathrooms and basements.

How can I clean up mold after a water leak or a flood?
- Remove all the items that have been wet for more than 48 hours if they cannot be thoroughly cleaned and dried. These may include carpeting, upholstery, wallpaper, drywall, floor and ceiling tiles, insulation material, clothing, leather, paper, wood, and food.
- To remove mold growth from hard surfaces, use commercial products or a bleach solution of 1 cup of bleach in 1 gallon of water. A study showed that a bleach solution is the best way to kill mold and the toxic substances made by molds. Do not mix bleach with ammonia or other household cleaners.
- Wear non-porous gloves and eye protection, and have good air ventilation while cleaning. If you are pregnant consider asking someone else to clean for you, particularly in areas with poor ventilation.
- Professional companies can also be hired to clean up the flooded basement or other household areas.
I have heard that Stachybotrys is a mold that is worse than the other common molds. Should I be worried if I have this mold in my home?

*Stachybotrys* is a greenish-black mold. It is not very common in homes, but it is not rare either. There are a few reports of molds such as *Stachybotrys* causing bleeding in the lungs in infants. These case reports are rare and there is not enough information at this time to prove a connection.

If you think that your home may have *Stachybotrys*, you do NOT need to have it tested. ALL molds could possibly cause health problems, so they should all be cleaned and removed as soon as possible. *Stachybotrys* should be removed in the same way as any other type of mold.

I am pregnant and there is mold in my home. Is my pregnancy at risk?

There are no human studies looking at exposure to mold during pregnancy. Studies in animals have shown that the substances that mold produce can increase the risk of birth defects when consumed by mouth. Currently, however, there is no proven risk to a pregnancy from exposure to airborne mold.

If you are pregnant and you have found mold in your home, you should have it removed as soon as possible. Talk to your healthcare provider if you are experiencing any illness that you think could be from mold exposure.

What if there is mold in my home while I’m breastfeeding?

There are no studies looking at exposure to mold during breastfeeding. Because mold in the home may possibly make both the mother and baby sick, it should be removed from the home as soon as possible. Be sure to discuss all your choices for breastfeeding with your healthcare provider.

What if the father of the baby is exposed to mold?

There are no studies looking at possible risks to a pregnancy when the father is exposed to mold. In general, exposures that fathers have are unlikely to increase the risk to a pregnancy. For more information, please see the Paternal Exposures fact sheet at [http://www.mothertobaby.org/files/paternal.pdf](http://www.mothertobaby.org/files/paternal.pdf).
